Creation of Appropriate Fragmentation
Conclusion and Future Work

## Confidentiality by Fragmentation

## Achieving Confidentiality by Breaking Associations

Today: Information is an important ressource
$\rightarrow$ Confidentiality of information is important
Often: Only associations between pieces of information sensitive
Example: Situation in a hospital

- List of illnesses cured $\rightsquigarrow$ Not sensitive
- List of patients $\rightsquigarrow$ Not really sensitive
- Association: Patient and his illness $\rightarrow$ Very sensitive

Goal: Confidentiality by breaking sensitive associations

## Context of our contribution

Existing approach: Confidentiality by vertical fragmentation (by Aggarwal, Bawa, et al.)

- Formal framework of fragmentation (More or less)
- Formal declaration of confidentiality requirements
- Efficient computation of fragmented instances
- Answering queries over fragmented databases
- No formal proof of inference-proofness

## Towards an Approach to Fragmentation

Assumptions: Underlying client-server framework

- Two servers, both honest, but curious
- No cooperation between servers
- Each server stores exactly one of two fragments
- Attacker has access to at most one server
- No persistent local storage
- All data must be stored externally
- Client only processes queries
- Authorized user has access to both servers (via client)

## Assumptions About the Encryption Function

Approach employs encryption within fragmentation
Encryption function Enc: $\mathcal{U} \times \mathcal{U} \rightarrow \mathcal{U}$ satisfies group properties

- Each value of $\mathcal{U}$ can be a
- Plaintext v
- Cryptographic key $\kappa$
- Ciphertext $e$
- Given an arbitrary pair of two values $\in\{v, \kappa, e\}$ The missing value $\in\{v, \kappa, e\}$ can be determined s.t.
$\operatorname{Enc}(v, \kappa)=e$ holds
- Decryption function: $\operatorname{Dec}(e, \kappa)=v$ iff $\operatorname{Enc}(v, \kappa)=e$

## Fragmentation Compliant with Assumptions

Fragmentation $(\mathcal{F}, \mathcal{E})$ of instance $r$ over schema $\langle R| A_{R}\left|S C_{R}\right\rangle$

- On schema level
- Distinguished attribute $a_{\mathrm{tid}} \notin A_{R}$ for tuple identifiers (TIDs)
- Set of "encrypted attributes" $\mathcal{E} \subseteq A_{R}$
- Set of fragments $\mathcal{F}=\left\{\left\langle F_{1}\right| A_{F_{1}}\left|S C_{F_{1}}\right\rangle,\left\langle F_{2}\right| A_{F_{2}}\left|S C_{F_{2}}\right\rangle\right\}$
- $A_{F_{i}}:=\left\{a_{\mathrm{tid}}\right\} \cup \bar{A}_{F_{i}}$ with $\quad \bar{A}_{F_{i}} \subseteq A_{R}$
- $S C_{F_{i}}:=\left\{a_{\text {tid }} \rightarrow \bar{A}_{F_{i}}\right\} \quad$ (Functional dependency)
- $\bar{A}_{F_{1}} \cup \bar{A}_{F_{2}}=A_{R}$ and $\bar{A}_{F_{1}} \cap \bar{A}_{F_{2}}=\mathcal{E}$
- On instance level
- Instances $f_{1}$ over $\left\langle F_{1}\right| A_{F_{1}}\left|S C_{F_{1}}\right\rangle$ and $f_{2}$ over $\left\langle F_{2}\right| A_{F_{2}}\left|S C_{F_{2}}\right\rangle$
- For each $\mu \in r$ : exactly one $\nu_{1} \in f_{1}$, exactly one $\nu_{2} \in f_{2}$ with
- $\nu_{1}\left[a_{\mathrm{tid}}\right]=\nu_{2}\left[a_{\mathrm{tid}}\right]=v_{\mu} \quad$ s.t. $\quad v_{\mu}$ is globally unique
- $\nu_{i}[a]:=\mu[a]$ for each $a \in\left(\bar{A}_{F_{i}} \backslash \mathcal{E}\right), i \in\{1,2\}$
- $\nu_{1}[a]:=\operatorname{Enc}(\mu[a], \kappa)$ and $\nu_{2}[a]:=\kappa$ for each $a \in \mathcal{E}$ s.t. $\kappa$ is random but globally unique f.e. $\mu \in r, a \in \mathcal{E}$

## Fragmentation of Example Instance

| $R$ | SSN | Name | lliness | HurtBy | Doctor |
| :--- | :--- | :--- | :--- | :--- | :--- |
|  | 1234 | Hellmann | Borderline | Hellmann | White |
|  | 2345 | Dooley | Laceration | McKinley | Warren |
|  | 3456 | McKinley | Laceration | Dooley | Warren |
|  | 3456 | McKinley | Concussion | Dooley | Warren |

| $F_{1}$ | tid | SSN | Name | HurtBy | Doctor | $F_{\mathbf{2}}$ | tid | SSN | HurtBy | Illness |
| :--- | :---: | :---: | :--- | :---: | :--- | :--- | :---: | :---: | :---: | :--- |
|  | 1 | $e_{\boldsymbol{S}}^{1}$ | Hellmann | $e_{\boldsymbol{H}}^{1}$ | White |  | 1 | $\kappa_{\boldsymbol{S}}^{1}$ | $\kappa_{\boldsymbol{H}}^{1}$ | Borderline |
|  | 2 | $e_{\boldsymbol{S}}^{2}$ | Dooley | $e_{\boldsymbol{H}}^{2}$ | Warren |  | 2 | $\kappa_{\boldsymbol{S}}^{2}$ | $\kappa_{\boldsymbol{H}}^{2}$ | Laceration |
|  | 3 | $e_{\boldsymbol{S}}^{3}$ | McKinley | $e_{\boldsymbol{H}}^{3}$ | Warren |  | 3 | $\kappa_{\boldsymbol{S}}^{3}$ | $\kappa_{\boldsymbol{H}}^{3}$ | Laceration |
|  | 4 | $e_{\boldsymbol{S}}^{4}$ | McKinley | $e_{\boldsymbol{H}}^{4}$ | Warren |  | 4 | $\kappa_{\boldsymbol{S}}^{4}$ | $\kappa_{\boldsymbol{H}}^{4}$ | Concussion |

SSN and HurtBy are "encrypted attributes"

## Convention from now on

Consider: Rearrangement of columns of instances $r, f_{1}, f_{2}$
Suppose: $A_{R}=\left\{a_{1}, \ldots, a_{h}, a_{h+1}, \ldots, a_{k}, a_{k+1}, \ldots, a_{n}\right\}$ s.t.

|  | $A_{F_{i}} \backslash A_{R}$ | $\left(A_{F_{1}} \backslash \mathcal{E}\right) \cap A_{R}$ | $\mathcal{E} \cap A_{F_{i}} \cap A_{R}$ | $\left(A_{F_{2}} \backslash \mathcal{E}\right) \cap A_{R}$ |
| :---: | :---: | :---: | :---: | :---: |
| $A_{R}$ |  | $a_{1}, \ldots, a_{h}$ | $a_{h+1}, \ldots, a_{k}$ | $a_{k+1}, \ldots, a_{n}$ |
| $A_{F_{1}}$ | $a_{\text {tid }}$ | $a_{1}, \ldots, a_{h}$ | $a_{h+1}, \ldots, a_{k}$ |  |
| $A_{F_{2}}$ | $a_{\text {tid }}$ |  | $a_{h+1}, \ldots, a_{k}$ | $a_{k+1}, \ldots, a_{n}$ |

Attention: For $j \in\{h+1, \ldots, k\}$ : Same attributes, different values

- Tuple $\mu \in r: \mu\left[a_{j}\right]$ is a plaintext value
- Tuple $\nu_{1} \in f_{1}: \nu_{1}\left[a_{j}\right]$ is a ciphertext value
- Tuple $\nu_{2} \in f_{2}: \nu_{2}\left[a_{j}\right]$ is a cryptographic key

## Reconstructability of Original Instance r

Given: Fragment-instances $f_{1}$ and $f_{2}$ of original instance $r$
For $\nu_{1} \in f_{1}, \nu_{2} \in f_{2}$ with $\nu_{1}\left[a_{\mathrm{tid}}\right]=\nu_{2}\left[a_{\mathrm{tid}}\right]$ :

$$
\left.\begin{array}{rl}
\nu_{1} \diamond \nu_{2}=( & \nu_{1}\left[a_{1}\right], \ldots, \nu_{1}\left[a_{h}\right], \\
& \operatorname{Dec}\left(\nu_{1}\left[a_{h+1}\right], \nu_{2}\left[a_{h+1}\right]\right), \ldots, \operatorname{Dec}\left(\nu_{1}\left[a_{k}\right], \nu_{2}\left[a_{k}\right]\right), \\
& \nu_{2}\left[a_{k+1}\right], \ldots, \nu_{2}\left[a_{n}\right]
\end{array}\right)
$$

By fragmentation: $\nu_{1} \diamond \nu_{2} \in r$

For $\nu_{1} \in f_{1}, \nu_{2} \in f_{2}$ with $\nu_{1}\left[a_{\text {tid }}\right] \neq \nu_{2}\left[a_{\text {tid }}\right]$ :
$\nu_{1} \diamond \nu_{2}$ is undefined

## Formal Declaration of Confidentiality Requirements

How to declare confidentiality requirements?

Syntax: Confidentiality Constraint $c$ over $\langle R| A_{R}\left|S C_{R}\right\rangle$ : Non-empty subset $c \subseteq A_{R}$ of attributes

Semantics: Confidentiality of fragmentation

- Let $\mathcal{C}$ be a set of Confidentiality Constraints
- Fragmentation $(\mathcal{F}, \mathcal{E})$ is confidential w.r.t. $\mathcal{C} \Leftrightarrow$ For $i \in\{1,2\}: c \nsubseteq\left(A_{F_{i}} \backslash \mathcal{E}\right)$ for all $c \in \mathcal{C}$

## Confidential Fragmentation of Example Instance

| $R$ | SSN | Name | Illness | HurtBy | Doctor |
| :--- | :--- | :--- | :--- | :--- | :--- |
|  | 1234 | Hellmann | Borderline | Hellmann | White |
|  | 2345 | Dooley | Laceration | McKinley | Warren |
|  | 3456 | McKinley | Laceration | Dooley | Warren |
|  | 3456 | McKinley | Concussion | Dooley | Warren |

| $F_{1}$ | tid | SSN | Name | HurtBy | Doctor |  | $F_{2}$ | tid | SSN | HurtBy | Illness |
| :--- | :---: | :---: | :--- | :---: | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
|  | 1 | $e_{\boldsymbol{S}}^{1}$ | Hellmann | $e_{\boldsymbol{H}}^{1}$ | White |  | 1 | $\kappa_{\boldsymbol{S}}^{1}$ | $\kappa_{\boldsymbol{H}}^{1}$ | Borderline |  |
|  | 2 | $e_{\boldsymbol{S}}^{2}$ | Dooley | $e_{\boldsymbol{H}}^{2}$ | Warren |  | 2 | $\kappa_{\boldsymbol{S}}^{2}$ | $\kappa_{\boldsymbol{H}}^{2}$ | Laceration |  |
|  | 3 | $e_{S}^{3}$ | McKinley | $e_{\boldsymbol{H}}^{3}$ | Warren |  | 3 | $\kappa_{\boldsymbol{S}}^{3}$ | $\kappa_{\boldsymbol{H}}^{3}$ | Laceration |  |
|  | 4 | $e_{\boldsymbol{S}}^{4}$ | McKinley | $e_{\boldsymbol{H}}^{4}$ | Warren |  | 4 | $\kappa_{\boldsymbol{S}}^{4}$ | $\kappa_{\boldsymbol{H}}^{4}$ | Concussion |  |

is confidential w.r.t.

$$
\left.\begin{array}{ll}
\mathcal{C}=\{ & c_{1}=\{\text { SSN }\},
\end{array} \quad c_{3}=\{\text { Name, HurtBy }\}, ~ 子, ~ c_{2}=\{\text { Name }, \text { Illness }\}, \quad c_{4}=\{\text { Illness }, \text { HurtBy }\} \quad\right\}
$$

## Inference-Proofness of Fragmentation

## Approach to Show Inference-Proofness

How to analyze inference-proofness?

- Controlled Interaction Execution (CIE) is known to be inference-proof
- Logic-oriented modelling of fragmentation within CIE-Framework from attacker's point of view
- Formal proof within logic-oriented framework

## Construction of an Appropriate Logic: Syntax

Language $\mathscr{L}$ : First-order logic with equality

- Set $\mathcal{P}$ of predicate symbols
- $F_{1}$ with arity $k+1=\left|A_{F_{1}}\right|$
- $F_{2}$ with arity $n-h+1=\left|A_{F_{2}}\right|$
- $R$ with arity $n=\left|A_{R}\right|$
- Distinguished binary predicate symbol $\equiv$
- A term of an atomic formula can be a
- Binary function symbol $E, D$
- Constant symbol of fixed infinite domain Dom
- Variable of infinite set Var $:=\left\{X_{1}, X_{2}, \ldots, Y_{1}, Y_{2}, \ldots\right\}$

## Construction of an Appropriate Logic: Semantics

Interpretation $\mathcal{I}$ for $\mathscr{L}$ is a DB-Interpretation iff

- Universe $\mathcal{U}:=\mathcal{I}(D o m)=D o m$
- $\mathcal{I}(v)=v \quad$ for all $v \in \operatorname{Dom}$
- $\mathcal{I}(E)(v, \kappa)=e$ iff $\operatorname{Enc}(v, \kappa)=e$
- $\mathcal{I}(D)(e, \kappa)=v$ iff $\operatorname{Dec}(e, \kappa)=v$
- $P \in \mathcal{P}$ with arity $m$ is interpreted by finite set $\mathcal{I}(P) \subset \mathcal{U}^{m}$
- $\mathcal{I}(\equiv)=\{(v, v) \mid v \in \mathcal{U}\}$

Complete instances $r, f_{1}$ and $f_{2}$ induce DB-Interpretation $\mathcal{I}_{r}$

- $\left(v_{1}, \ldots, v_{n}\right) \in \mathcal{I}_{r}(R)$ iff $\left(v_{1}, \ldots, v_{n}\right) \in r$
- Analogously for $\mathcal{I}_{r}\left(F_{1}\right), \mathcal{I}_{r}\left(F_{2}\right)$ induced by fragments $f_{1}, f_{2}$ of $r$

## Satisfaction and Implication Based on DB-Interpretation

Satisfaction of sentences (closed formulas) of $\mathscr{L}$

- Notation of satisfaction
- Consider: DB-Interpretation $\mathcal{I}$, set of sentences $\mathcal{S} \subset \mathscr{L}$
- $\mathcal{I}$ satisfies $\mathcal{S}$ written as $\mathcal{I} \models_{M} \mathcal{S}$
- Semantics of satisfaction: Same as in usual first-order logic

Implication based on DB-Interpretation

- Notation: $\mathcal{S} \subset \mathscr{L}$ implies $\Phi \in \mathscr{L}$ written as $\mathcal{S} \models_{D B} \Phi$
- Semantics: $\mathcal{S} \models_{D B} \Phi$ iff

For each DB-Interpretation $\mathcal{I}$ : If $\mathcal{I} \models_{M} \mathcal{S}$ then $\mathcal{I} \models_{M} \Phi$

## Modelling the Positive Knowledge of $f_{1}$

Suppose: Attacker knows

- Outsourced fragment instance $f_{1}$
- Fragment $\left\langle F_{1}\right| A_{F_{1}}\left|S C_{F_{1}}\right\rangle$ with $A_{F_{1}}=\left\{a_{\mathrm{tid}}, a_{1}, \ldots, a_{k}\right\}$

Attacker's explicit positive knowlegde of $f_{1}$

- $d b_{f_{1}}^{+}:=\left\{F_{1}\left(\nu\left[a_{\text {tid }}\right], \nu\left[a_{1}\right], \ldots, \nu\left[a_{k}\right]\right) \mid \nu \in f_{1}\right\}$
- Functional dependency $a_{\mathrm{tid}} \rightarrow\left\{a_{1}, \ldots, a_{k}\right\} \in S C_{F_{1}}$

## Negative Knowledge Resulting from Completeness

Problem: An attacker knows even more about $f_{1}$

- Instances $r, f_{1}$ and $f_{2}$ are supposed to be complete
- Every constant combination not in $f_{1}$ is invalid by CWA $\rightarrow$ Knowledge of the kind $\neg F_{1}\left(v_{\mathrm{tid}}, v_{1}, \ldots, v_{k}\right)$
- Problem: Infinite Domain $\rightarrow$ Not explicitly enumerable
- Bright idea: Use Completeness-Sentence to model CWA

## Construction of Completeness Sentence: Example

| $F_{\mathbf{1}}$ | tid | SSN | Name | HurtBy | Doctor |
| :--- | :---: | :---: | :--- | :---: | :--- |
|  | 1 | $e_{\boldsymbol{S}}^{\mathbf{S}}$ | Hellmann | $e_{\boldsymbol{H}}^{\mathbf{H}}$ | White |
|  | 2 | $e_{\boldsymbol{S}}^{\mathbf{S}}$ | Dooley | $e_{\boldsymbol{H}}^{2}$ | Warren |
|  | 3 | $e_{\boldsymbol{S}}^{\mathbf{3}}$ | McKinley | $e_{\boldsymbol{H}}^{3}$ | Warren |
|  | 4 | $e_{\boldsymbol{S}}^{4}$ | McKinley | $e_{\boldsymbol{H}}^{4}$ | Warren |

Completeness sentence resulting from $f_{1}$ :

$$
\begin{aligned}
& \left(\forall X_{t}\right)\left(\forall X_{S}\right)\left(\forall X_{N}\right)\left(\forall X_{H}\right)\left(\forall X_{D}\right)[ \\
& \left(X_{t} \equiv 1 \wedge X_{S} \equiv e_{S}^{1} \wedge X_{N} \equiv \text { Hellmann } \wedge X_{H} \equiv e_{H}^{1} \wedge X_{D} \equiv \text { White }\right) \vee \\
& \left(X_{t} \equiv 2 \wedge X_{S} \equiv e_{S}^{2} \wedge X_{N} \equiv \text { Dooley } \wedge X_{H} \equiv e_{H}^{2} \wedge X_{D} \equiv \text { Warren }\right) \vee \\
& \left(X_{t} \equiv 3 \wedge X_{S} \equiv e_{S}^{3} \wedge X_{N} \equiv \text { McKinley } \wedge X_{H} \equiv e_{H}^{3} \wedge X_{D} \equiv \text { Warren }\right) \vee \\
& \left(X_{t} \equiv 4 \wedge X_{S} \equiv e_{S}^{4} \wedge X_{N} \equiv \text { McKinley } \wedge X_{H} \equiv e_{H}^{4} \wedge X_{D} \equiv \text { Warren }\right) \vee \\
& \neg F_{1}\left(X_{t}, X_{S}, X_{N}, X_{H}, X_{D}\right)
\end{aligned}
$$

## Modelling the Negative Knowledge of $f_{1}$

Completeness sentence for running example:

$$
\begin{aligned}
& \left(\forall X_{t}\right)\left(\forall X_{S}\right)\left(\forall X_{N}\right)\left(\forall X_{H}\right)\left(\forall X_{D}\right)[ \\
& \left(X_{t} \equiv 1 \wedge X_{S} \equiv e_{S}^{1} \wedge X_{N} \equiv \text { Hellmann } \wedge X_{H} \equiv e_{H}^{1} \wedge X_{D} \equiv \text { White }\right) \vee \\
& \left(X_{t} \equiv 2 \wedge X_{S} \equiv e_{S}^{2} \wedge X_{N} \equiv \text { Dooley } \wedge X_{H} \equiv e_{H}^{2} \wedge X_{D} \equiv \text { Warren }\right) \vee \\
& \left(X_{t} \equiv 3 \wedge X_{S} \equiv e_{S}^{3} \wedge X_{N} \equiv \text { MCKinley } \wedge X_{H} \equiv e_{H}^{3} \wedge X_{D} \equiv \text { Warren }\right) \vee \\
& \left(X_{t} \equiv 4 \wedge X_{S} \equiv e_{S}^{4} \wedge X_{N} \equiv \text { McKinley } \wedge X_{H} \equiv e_{H}^{4} \wedge X_{D} \equiv \text { Warren }\right) \vee \\
& \neg F_{1}\left(X_{t}, X_{S}, X_{N}, X_{H}, X_{D}\right)
\end{aligned}
$$

Construction of Completeness Sentence of $d b_{f_{1}}^{-}$in general:

$$
\left(\forall X_{\mathrm{tid}}\right) \ldots\left(\forall X_{k}\right)\left[\bigvee_{\nu \in f_{1}}\left(\bigwedge_{a_{j} \in A_{F_{1}}}\left(X_{j} \equiv \nu\left[a_{j}\right]\right)\right) \vee \neg F_{1}\left(X_{\mathrm{tid}}, X_{1}, \ldots, X_{k}\right)\right]
$$

## Final Logic-Oriented View on $f_{1}$

Summing up: A logic-oriented view on $f_{1}$ is modelled by

$$
d b_{f_{1}}:=d b_{f_{1}}^{+} \cup d b_{f_{1}}^{-} \cup\left\{a_{\text {tid }} \rightarrow\left\{a_{1}, \ldots, a_{k}\right\}\right\}
$$

But: Attacker is curious about original instance $r$ (or $f_{2}$, respectively)

## Attacker's Knowledge About $r$ and $f_{2}(1)$

Suppose: Attacker knows

- Schema $\langle R| A_{R}\left|S C_{R}\right\rangle$ over which original instance $r$ is built
- Process of fragmentation (algorithm)
- Computed fragmentation $\mathcal{F}=\left\{\left\langle F_{1}\right| A_{F_{1}}\left|S C_{F_{1}}\right\rangle,\left\langle F_{2}\right| A_{F_{2}}\left|S C_{F_{2}}\right\rangle\right\}$

Suppose: Attacker has no access to

- Original instance $r$ (not materialized at all)
- Fragment instance $f_{2}$ (hosted by "other" server)

Suppose: Attacker is curious about $r$ (or $f_{2}$, respectively)

Database Fragmentation with Encryption: Can Two Keep a Secret?
L Inference-Proofness of Fragmentation
LLogic-Oriented View on Fragmentation

## Attacker's Knowledge About $r$ and $f_{2}(2)$

Attacker's deductions: For each $\nu_{1} \in f_{1}$

- Tuple $\nu_{2} \in f_{2}$ with $\nu_{2}\left[a_{\mathrm{tid}}\right]=\nu_{1}\left[a_{\mathrm{tid}}\right]$ exists
- Tuple $\mu \in r$ with $\nu_{1} \diamond \nu_{2}=\mu$ exists

Knowledge expressed as a sentence of $d b_{R}$ :

$$
\begin{aligned}
& \left(\forall X_{\text {tid }}\right)\left(\forall X_{1}\right) \ldots\left(\forall X_{h}\right)\left(\forall X_{h+1}\right) \ldots\left(\forall X_{k}\right)[ \\
& \quad F_{1}\left(X_{\text {tid }}, X_{1}, \ldots, X_{h}, X_{h+1}, \ldots, X_{k}\right) \\
& \quad \Rightarrow \\
& \quad\left(\exists Y_{h+1}\right) \ldots\left(\exists Y_{k}\right)\left(\exists Z_{k+1}\right) \ldots\left(\exists Z_{n}\right)[ \\
& \quad F_{2}\left(X_{\text {tid }}, Y_{h+1}, \ldots, Y_{k}, Z_{k+1}, \ldots, Z_{n}\right) \wedge \\
& \left.\left.\quad R\left(X_{1}, \ldots, X_{h}, D\left(X_{h+1}, Y_{h+1}\right), \ldots, D\left(X_{k}, Y_{k}\right), Z_{k+1}, \ldots, Z_{n}\right)\right]\right]
\end{aligned}
$$

Database Fragmentation with Encryption: Can Two Keep a Secret?
L Inference-Proofness of Fragmentation
LLogic-Oriented View on Fragmentation

## Attacker's Knowledge About $r$ and $f_{2}(3)$

The equivalence does not hold!
Supposed fragmentation with "encrypted attribute" $a_{2}$ :

| $R$ | $a_{1}$ | $a_{2}$ | $a_{3}$ | $F_{1}$ | $a_{\text {tid }}$ | $a_{1}$ | $a_{2}$ | $F_{2}$ | $a_{\text {tid }}$ | $a_{2}$ | $a_{3}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $V_{1}$ | $V_{2}$ | $V_{3}$ |  | 1 | $v_{1}$ | $c_{2}$ |  | 1 | $\kappa_{2}$ | $V_{3}$ |
|  | $v_{1}^{\prime}$ | $v_{2}$ | $V_{3}$ |  | 2 | $v_{1}^{\prime}$ | $c_{2}^{\prime}$ |  | 2 | $\kappa_{2}^{\prime}$ | $v_{3}$ |

Implication possible under equivalence:

$$
[F_{2}\left(1, \kappa_{2}, v_{3}\right) \wedge R(v_{1}^{\prime}, \overbrace{D\left(\square, \kappa_{2}\right)}^{=v_{2}}, v_{3})] \Rightarrow F_{1}\left(1, v_{1}^{\prime}, \square\right)
$$

By properties of perfect encryption: $D\left(\square, \kappa_{2}\right)=v_{2}$ iff $\square=c_{2}$
$\rightarrow$ Tuple $\left(1, v_{1}^{\prime}, c_{2}\right) \in f_{1}$ \&

## Attacker's Knowledge About $r$ and $f_{2}(4)$

Attacker's deductions: Tuple $\nu_{2} \in f_{2}$ can only exist if

- Tuple $\nu_{1} \in f_{1}$ with $\nu_{1}\left[a_{\mathrm{tid}}\right]=\nu_{2}\left[a_{\mathrm{tid}}\right]$ exists
- Tuple $\mu \in r$ with $\nu_{1} \diamond \nu_{2}=\mu$ exists

Knowledge expressed as a sentence of $d b_{R}$ :

$$
\begin{aligned}
& \left(\forall X_{\text {tid }}\right)\left(\forall X_{h+1}\right) \ldots\left(\forall X_{k}\right)\left(\forall X_{k+1}\right) \ldots\left(\forall X_{n}\right)[ \\
& \quad F_{2}\left(X_{\text {tid }}, X_{h+1}, \ldots, X_{k}, X_{k+1}, \ldots, X_{n}\right) \\
& \quad \Rightarrow \\
& \quad\left(\exists Y_{1}\right) \ldots\left(\exists Y_{h}\right)\left(\exists Z_{h+1}\right) \ldots\left(\exists Z_{k}\right)[ \\
& \quad F_{1}\left(X_{\mathrm{tid}}, Y_{1}, \ldots, Y_{h}, Z_{h+1}, \ldots, Z_{k}\right) \wedge \\
& \left.\left.\quad R\left(Y_{1}, \ldots, Y_{h}, D\left(Z_{h+1}, X_{h+1}\right), \ldots, D\left(Z_{k}, X_{k}\right), X_{k+1}, \ldots, X_{n}\right)\right]\right]
\end{aligned}
$$

Database Fragmentation with Encryption: Can Two Keep a Secret?
L Inference-Proofness of Fragmentation
LLogic-Oriented View on Fragmentation

## Attacker's Knowledge About $r$ and $f_{2}(5)$

The equivalence does not hold!
Supposed fragmentation with "encrypted attribute" $a_{2}$ :

| $R$ | $a_{1}$ | $a_{2}$ | $a_{3}$ | $F_{1}$ | $a_{\text {tid }}$ | $a_{1}$ | $a_{2}$ | $F_{2}$ | $a_{\text {tid }}$ | $a_{2}$ | $a_{3}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $v_{1}$ | $V_{2}$ | $V_{3}$ |  | 1 | $v_{1}$ | $c_{2}$ |  | 1 | $\kappa_{2}$ | $V_{3}$ |
|  | $v_{1}$ | $v_{2}$ |  |  | 2 | $v_{1}$ | $c_{2}^{\prime}$ |  | 2 | $\kappa_{2}^{\prime}$ | $v_{3}^{\prime}$ |

Implication possible under equivalence:

$$
[F_{1}\left(1, v_{1}, c_{2}\right) \wedge R(v_{1}, \overbrace{D\left(c_{2}, \square\right)}^{=v_{2}}, v_{3}^{\prime})] \Rightarrow F_{2}\left(1, \square, v_{3}^{\prime}\right)
$$

By properties of perfect encryption: $D\left(c_{2}, \square\right)=v_{2}$ iff $\square=\kappa_{2}$
$\rightarrow$ Tuple $\left(1, \kappa_{2}, v_{3}^{\prime}\right) \in f_{2}$ 亿

## Attacker's Knowledge About $r$ and $f_{2}(6)$

Attacker's deductions: Tuple $\mu \in r$ exists iff

- Tuples $\nu_{1} \in f_{1}$ and $\nu_{2} \in f_{2}$ with $\nu_{1}\left[a_{\text {tid }}\right]=\nu_{2}\left[a_{\text {tid }}\right]$ exist s.t.
- $\nu_{1} \diamond \nu_{2}=\mu$ holds

Knowledge expressed as a sentence of $d b_{R}$ :

$$
\begin{aligned}
& \left(\forall X_{1}\right) \ldots\left(\forall X_{h}\right)\left(\forall X_{h+1}\right) \ldots\left(\forall X_{k}\right)\left(\forall X_{k+1}\right) \ldots\left(\forall X_{n}\right)[ \\
& \quad R\left(X_{1}, \ldots, X_{h}, X_{h+1}, \ldots, X_{k}, X_{k+1}, \ldots, X_{n}\right) \\
& \quad \Leftrightarrow \\
& \left(\exists Z_{\text {tid }}\right)\left(\exists Y_{h+1}\right) \ldots\left(\exists Y_{k}\right)[ \\
& \quad F_{2}\left(Z_{\text {tid }}, Y_{h+1}, \ldots, Y_{k}, X_{k+1}, \ldots, X_{n}\right) \wedge \\
& \left.\left.\quad F_{1}\left(Z_{\text {tid }}, X_{1}, \ldots, X_{h}, E\left(X_{h+1}, Y_{h+1}\right), \ldots, E\left(X_{k}, Y_{k}\right)\right)\right]\right]
\end{aligned}
$$

Here: Equivalence holds by fragmentation!

## Attacker's Knowledge About $r$ and $f_{2}(7)$

Attacker's deductions: By fragmentation and tuple-IDs

- If different tuples $\nu_{1}, \nu_{1}^{\prime} \in f_{1}$ are equal w.r.t. $\left(A_{F_{1}} \cap A_{R}\right) \backslash \mathcal{E}$, corresponding $\mu, \mu^{\prime} \in r$ are equal w.r.t. $\left(A_{F_{1}} \cap A_{R}\right) \backslash \mathcal{E}$
- But: $\mu$ and $\mu^{\prime}$ cannot be duplicates

Knowledge expressed as a sentence of $d b_{R}$ :

$$
\begin{aligned}
& \left(\forall X_{\mathrm{tid}}\right)\left(\forall X_{\mathrm{tid}}^{\prime}\right)\left(\forall X_{1}\right) \ldots\left(\forall X_{h}\right)\left(\forall X_{h+1}\right) \ldots\left(\forall X_{k}\right)\left(\forall X_{h+1}^{\prime}\right) \ldots\left(\forall X_{k}^{\prime}\right)[ \\
& \quad\left[F_{1}\left(X_{\mathrm{tid}}, X_{1}, \ldots, X_{h}, X_{h+1}, \ldots, X_{k}\right) \wedge\right. \\
& \left.\quad F_{1}\left(X_{\mathrm{tid}}^{\prime}, X_{1}, \ldots, X_{h}, X_{h+1}^{\prime}, \ldots, X_{k}^{\prime}\right) \wedge\left(X_{\mathrm{tid}} \neq X_{\mathrm{tid}}^{\prime}\right)\right] \\
& \quad \Rightarrow \\
& \quad\left(\exists Y_{h+1}\right) \ldots\left(\exists Y_{n}\right)\left(\exists Z_{h+1}\right) \ldots\left(\exists Z_{n}\right)[ \\
& \quad R\left(X_{1}, \ldots, X_{h}, Y_{h+1}, \ldots, Y_{k}, Y_{k+1}, \ldots, Y_{n}\right) \wedge \\
& \left.\left.\quad R\left(X_{1}, \ldots, X_{h}, Z_{h+1}, \ldots, Z_{k}, Z_{k+1}, \ldots, Z_{n}\right) \wedge \bigvee_{j=h+1}^{n}\left(Y_{j} \neq Z_{j}\right)\right]\right]
\end{aligned}
$$

## Attacker's Knowledge About $r$ and $f_{2}(8)$

Attacker's deductions: By fragmentation and tuple-IDs

- If different tuples $\nu_{2}, \nu_{2}^{\prime} \in f_{2}$ are equal w.r.t. $\left(A_{F_{2}} \cap A_{R}\right) \backslash \mathcal{E}$, corresponding $\mu, \mu^{\prime} \in r$ are equal w.r.t. $\left(A_{F_{2}} \cap A_{R}\right) \backslash \mathcal{E}$
- But: $\mu$ and $\mu^{\prime}$ cannot be duplicates

Knowledge expressed as a sentence of $d b_{R}$ :

$$
\begin{aligned}
& \left(\forall X_{\mathrm{tid}}\right)\left(\forall X_{\mathrm{tid}}^{\prime}\right)\left(\forall X_{h+1}\right) \ldots\left(\forall X_{k}\right)\left(\forall X_{h+1}^{\prime}\right) \ldots\left(\forall X_{k}^{\prime}\right)\left(\forall X_{k+1}\right) \ldots\left(\forall X_{n}\right)[ \\
& \quad\left[F_{2}\left(X_{\mathrm{tid}}, X_{h+1}, \ldots, X_{k}, X_{k+1}, \ldots, X_{n}\right) \wedge\right. \\
& \left.\quad F_{2}\left(X_{\mathrm{tid}}^{\prime}, X_{h+1}^{\prime}, \ldots, X_{k}^{\prime}, X_{k+1}, \ldots, X_{n}\right) \wedge\left(X_{\mathrm{tid}} \neq X_{\mathrm{tid}}^{\prime}\right)\right] \\
& \quad \Rightarrow
\end{aligned}
$$

$$
\begin{aligned}
& \left(\exists Y_{1}\right) \ldots\left(\exists Y_{k}\right)\left(\exists Z_{1}\right) \ldots\left(\exists Z_{k}\right)[ \\
& \quad R\left(Y_{1}, \ldots, Y_{h}, Y_{h+1}, \ldots, Y_{k}, X_{k+1}, \ldots, X_{n}\right) \wedge \\
& \left.\left.\quad R\left(Z_{1}, \ldots, Z_{h}, Z_{h+1}, \ldots, Z_{k}, X_{k+1}, \ldots, X_{n}\right) \wedge \bigvee_{j=1}^{k}\left(Y_{j} \neq Z_{j}\right)\right]\right]
\end{aligned}
$$

## Confidentiality Constraints in the CIE-Framework

Design choice: Confidentiality constraints as potential secrets

- Supposition: Only those values or associations explicitly recorded in $r$ are protected by confidentiality constraints
- About a potential secret $\Psi \in \mathscr{L}$ defined for a user:
- $\Psi$ is a logic sentence
- If $\Psi$ is true in instance $r$ : User must not get to know this
- Otherwise: User may know that $\Psi$ is false in instance $r$
- Assume: An attacker is aware of $\mathcal{C}$

## Bridging the Differences

From Confidentiality Constraints to Potential Secrets

- Consider a confidentiality constraint $c_{i}=\left\{a_{i_{1}}, \ldots, a_{i_{\ell}}\right\}$
- Protect all constant combinations possible for $a_{i_{1}}, \ldots, a_{i_{\ell}}$
- Otherwise: Attacker can read secrets directly from potsec(C)
- But: Leads to an infinite number of sentences (as $|\operatorname{Dom}|=\infty$ ) $\rightarrow$ One potential secret per possible constant combination
- Use free variables $X_{i_{1}}, \ldots, X_{i_{\ell}}$ to represent $a_{i_{1}}, \ldots, a_{i_{\ell}}$

## Modelling of Confidentiality Constraints

Consider: Confidentiality constraint $c_{i} \in \mathcal{C}$

- $c_{i}=\left\{a_{i_{1}}, \ldots, a_{i_{\ell}}\right\} \subseteq\left\{a_{1}, \ldots, a_{n}\right\}=A_{R}$
- $A_{R} \backslash c_{i}=\left\{a_{i_{\ell+1}}, \ldots, a_{i_{n}}\right\}$

Construction of potsec $(\mathcal{C})$ :

- For all $c_{i} \in \mathcal{C}$ : Add potential secret

$$
\Psi_{i}\left(\boldsymbol{X}_{\boldsymbol{i}}\right)=\left(\exists X_{i_{\ell+1}}\right) \ldots\left(\exists X_{i_{n}}\right) R\left(X_{1}, \ldots, X_{n}\right)
$$

- $\boldsymbol{X}_{\boldsymbol{i}}=\left(X_{i_{1}}, \ldots, X_{i_{\ell}}\right)$ is the vector of free variables of $\Psi_{i}\left(\boldsymbol{X}_{\boldsymbol{i}}\right)$

## Expansion of the Confidentiality Policy

Given: $\Psi_{i}\left(\boldsymbol{X}_{\boldsymbol{i}}\right)$ with $\boldsymbol{X}_{\boldsymbol{i}}=\left(X_{i_{1}}, \ldots, X_{i \ell}\right)$
Solution: Expansion $\operatorname{ex}\left(\Psi_{i}\left(\boldsymbol{X}_{\boldsymbol{i}}\right)\right) \subset \mathscr{L}$

- Consider each $\boldsymbol{v}_{\boldsymbol{i}}=\left(v_{i_{1}}, \ldots, v_{i_{\ell}}\right) \in$ Dom $^{\ell}$
- Construct each sentence $\Psi_{i}\left(\boldsymbol{v}_{\boldsymbol{i}}\right)$

Expansion of potsec $(\mathcal{C})$ :

$$
\operatorname{ex}(\operatorname{potsec}(\mathcal{C})):=\bigcup_{\Psi(\boldsymbol{X}) \in \operatorname{potsec}(\mathcal{C})} \operatorname{ex}(\Psi(\boldsymbol{X}))
$$

## The Impact of A-Priori Knowledge: Survey

Known now: Logic-oriented view on fragmentation
Until now: Attacker's a priori knowledge has been neglected

- Knowledge about the world in general
- Knowledge about semantic database constraints $S C_{R}$

Survey of the following results

- No inference-proofness under general a priori knowledge $z$
- Inference-proofness under constrained a priori knowledge

Goal: Construction of confidential fragmentation Complying with a priori knowledge

## The Impact of A Priori Knowledge: Example (1)

Attacker's view on $r$ based on $f_{1}$ :

| $R$ | SSN | Name | Illness | HurtBy | Doctor |
| :---: | :---: | :--- | :---: | :---: | :--- |
|  | $?$ | Hellmann | $?$ | $?$ | White |
|  | $?$ | Dooley | $?$ | $?$ | Warren |
|  | $?$ | McKinley | $?$ | $?$ | Warren |
|  | $?$ | McKinley | $?$ | $?$ | Warren |

Suppose attacker knows a priori:
"All patients of psychiatrist White suffer from Borderline."
As a sentence of $\mathscr{L}$ :
$\left(\forall X_{S}\right)\left(\forall X_{N}\right)\left(\forall X_{I}\right)\left(\forall X_{H}\right)\left[R\left(X_{S}, X_{N}, X_{I}, X_{H}\right.\right.$, White $) \Rightarrow\left(X_{I} \equiv\right.$ BLine $\left.)\right]$
Attacker's updated view on $r$ violates $c_{2}=\{$ Name, Illness $\}$ :

| $R$ | SSN | Name | Illness | HurtBy | Doctor |
| :---: | :---: | :--- | :--- | :---: | :--- |
|  | $?$ | Hellmann | Borderline | $?$ | White |

## The Impact of A Priori Knowledge: Example (2)

Attacker's updated view on original instance $r$ :

| $R$ | SSN | Name | Illness | HurtBy | Doctor |
| :---: | :---: | :--- | :---: | :---: | :--- |
|  | $?$ | Hellmann | Borderline | $?$ | White |
|  | $?$ | Dooley | $?$ | $?$ | Warren |
|  | $?$ | McKinley | $?$ | $?$ | Warren |
|  | $?$ | McKinley | $?$ | $?$ | Warren |

Suppose attacker knows a priori:
"All patients suffering from Borderline have hurt themselves."
As a sentence of $\mathscr{L}$ :
$\left(\forall X_{S}\right)\left(\forall X_{N}\right)\left(\forall X_{H}\right)\left(\forall X_{D}\right)\left[R\left(X_{S}, X_{N}\right.\right.$, BLine, $\left.\left.X_{H}, X_{D}\right) \Rightarrow\left(X_{N} \equiv X_{H}\right)\right]$
Attacker's updated view on $r$ violates $c_{3}=\{$ Name, HurtBy $\}$ :

| $R$ | SSN | Name | Illness | HurtBy | Doctor |
| :--- | :---: | :--- | :--- | :--- | :--- |
|  | $?$ | Hellmann | Borderline | Hellmann | White |

## About Inference-Proofness and A Priori Knowledge

Inference-Proofness: From attacker's point of view

- For each potential secret $\Psi_{i}\left(\boldsymbol{v}_{\boldsymbol{i}}\right) \in \operatorname{ex}(\operatorname{potsec}(\mathcal{C}))$
- Existence of alternative instance $r^{\prime}$ over $\langle R| A_{R}\left|S C_{R}\right\rangle$ possible
- $r^{\prime}$ is indistinguishable from original instance $r$
- $r^{\prime}$ does not satisfy $\Psi_{i}\left(\boldsymbol{v}_{\boldsymbol{i}}\right)$

About a priori knowledge prior

- Contains sentences over predicate symbols $R$ and $\equiv$
- Attacker knows: Original instance $r$ satisfies prior
- Consequently: Each $r^{\prime}$ also needs to satisfy prior

## Towards Inference-Proofness of Alternative Instance

Create inference-proof alternative instance $r^{\prime}$ w.r.t.

- Single potential secret $\Psi_{i}\left(v_{\boldsymbol{i}}\right)$ with $\boldsymbol{v}_{\boldsymbol{i}}=\left(v_{i_{1}}, \ldots, v_{i_{\ell}}\right)$
- Attacker knows from $f_{1}: \pi_{\left(A_{F_{1}} \backslash \mathcal{E}\right)}(r)$
- Choose $m \in\left\{i_{1}, \ldots, i_{\ell}\right\}$ s.t. $a_{m} \notin\left(A_{F_{1}} \backslash \mathcal{E}\right) \quad$ (i.e. $\left.a_{m} \in \bar{A}_{F_{2}}\right)$
- Make sure: Column $a_{m}$ of $r^{\prime}$ does not contain $v_{m} \in \boldsymbol{v}_{\boldsymbol{i}}$
- Syntactically restricted sentence $\Gamma \in$ prior over $R$ and $\equiv$
- Attacker knows: $\Gamma$ is satisfied by $r$
- Adopt all columns $\left\{a_{1}, \ldots, a_{n}\right\} \backslash\left\{a_{m}\right\}$ of $r$ to construct $r^{\prime}$
- Ensure that $\Gamma$ does not require
- Constant $v_{m}$ to be in $m$-th column
- Equality between column $m$ and other column

## A Priori Knowledge and Multiple Potential Secrets

Consider example set $\mathcal{C}$ within $\langle R| A_{R}\left|S C_{R}\right\rangle$

| $R$ | SSN | Name | Illness | HurtBy | Doctor |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $c_{1}$ | $\times$ |  |  |  |  |
| $c_{2}$ |  | $\times$ | $\times$ |  |  |
| $c_{3}$ |  | $\times$ |  | $\times$ |  |
| $c_{4}$ |  |  | $\times$ | $\times$ |  |

- Columns Name and Doctor known from $f_{1}$ $\rightarrow$ Do not modify to preserve indistinguishability
- For each $\Psi_{i}\left(\boldsymbol{v}_{\boldsymbol{i}}\right)$ : To be able to construct $r^{\prime}$ protecting $\Psi_{i}\left(\boldsymbol{v}_{\boldsymbol{i}}\right)$ at least one column of $c_{i}$ must be modifiable
- Each $\Gamma \in$ prior must comply with all modifiable columns
- In each $(\neg) R(\ldots)$ of $\Gamma$ : No constants in modifiable columns
- No equalities expressed by variables between modifiable and non-modifiable columns

Database Fragmentation with Encryption: Can Two Keep a Secret?

## Definition of A Priori Knowledge

Each $\Gamma \in$ prior is built s.t.

- $\Gamma$ has form $(\forall x)(\exists y)\left[\bigvee_{j=1, \ldots, p} \neg R\left(t_{j, 1}, \ldots, t_{j, n}\right) \vee A_{p+1}\right]$
- $A_{p+1}$ is either $\left(t_{p+1,1} \equiv t_{p+1,2}\right)$ or $\bigwedge_{j=p+1, \ldots, q} R\left(t_{j, 1}, \ldots, t_{j, n}\right)$
- Each $t_{j, i}$ is a variable or a constant symbol
- $\Gamma$ is range-restricted: Each $X \in x$ occurs in a $\neg R(\ldots)$
- $\Gamma$ is not DB-tautologic: No $Y \in y$ occurs in a $\neg R(\ldots)$

## Definition of A Priori Knowledge

Moreover: prior must comply with "modifiable columns"
There exists a subset $M \subseteq\{h+1, \ldots, n\} \quad$ s.t.
(1) $M \cap\left\{i_{1}, \ldots, i_{\ell}\right\} \neq \emptyset$ for each $c_{i}=\left(a_{i_{1}}, \ldots, a_{i_{\ell}}\right) \in \mathcal{C}$
(2) For each $\Gamma \in$ prior exists a partioning $\mathcal{X}_{1}^{\Gamma} \dot{\cup} \mathcal{X}_{2}^{\Gamma}=\operatorname{Var}$ s.t.
(i) For each atom $R\left(t_{1}, \ldots, t_{n}\right)$ of $\Gamma$

- For $j \notin M$ : term $t_{j}$ is either a (quantified) variable of $\mathcal{X}_{1}^{\Gamma}$ or a constant symbol of Dom
- For $j \in M$ : term $t_{j}$ is a (quantified) variable of $\mathcal{X}_{2}^{\Gamma}$
(ii) For each atom $\left(X_{i} \equiv X_{j}\right)$ of $\Gamma$ :

Either $X_{i}, X_{j} \in \mathcal{X}_{1}^{\Gamma}$ or $X_{i}, X_{j} \in \mathcal{X}_{2}^{\Gamma}$
(iii) For each atom $\left(X_{i} \equiv v\right)$ of $\Gamma$ with $v \in$ Dom:

Variable $X_{i}$ is in $\mathcal{X}_{1}^{\Gamma}$

Database Fragmentation with Encryption: Can Two Keep a Secret?
L Inference-Proofness of Fragmentation
-Inference-Proofness under A Priori Knowledge

## Coarse Sketch of Proof

To be shown:
for all $\Psi(v) \in \operatorname{ex}(\operatorname{potsec}(\mathcal{C})): d b_{f_{1}} \cup d b_{R} \cup$ prior $\not \vDash_{D B} \Psi(v)$
Steps of proof:

1. Choose $\tilde{\Psi}(\boldsymbol{v}) \in \operatorname{ex}(\operatorname{potsec}(\mathcal{C}))$ arbitrarily
2. Construct a DB-Interpretation $\mathcal{I}_{r^{\prime}}$ with

$$
\mathcal{I}_{r^{\prime}} \models_{M}\left\{\begin{array}{l}
d b_{f_{1}} \\
d b_{R} \\
\text { prior }
\end{array} \quad\right. \text { (Indistinguishability) }
$$

$$
\mathcal{I}_{r^{\prime}} \not \neq M \tilde{\Psi}(v)
$$

(Non-violation of potential secret)

## Creation of Appropriate Fragmentation

## Alternative Fragmentation of Example Instance

| $R$ | SSN | Name | Illness | HurtBy | Doctor |
| :--- | :--- | :--- | :--- | :--- | :--- |
|  | 1234 | Hellmann | Borderline | Hellmann | White |
|  | 2345 | Dooley | Laceration | McKinley | Warren |
|  | 3456 | McKinley | Laceration | Dooley | Warren |
|  | 3456 | McKinley | Concussion | Dooley | Warren |

| $F_{1}$ | tid | SSN | lliness | HurtBy | Doctor |  | $F_{2}$ | tid | SSN | HurtBy | Name |
| :--- | :---: | :---: | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
|  | 1 | $e_{\boldsymbol{S}}^{1}$ | Borderline | $e_{\boldsymbol{H}}^{1}$ | White |  | 1 | $\kappa_{\boldsymbol{S}}^{1}$ | $\kappa_{\boldsymbol{H}}^{1}$ | Hellmann |  |
|  | 2 | $e_{\boldsymbol{S}}^{2}$ | Laceration | $e_{\boldsymbol{H}}^{2}$ | Warren |  | 2 | $\kappa_{\boldsymbol{S}}^{2}$ | $\kappa_{\boldsymbol{H}}^{2}$ | Dooley |  |
|  | 3 | $e_{\boldsymbol{S}}^{3}$ | Laceration | $e_{\boldsymbol{H}}^{3}$ | Warren |  | 3 | $\kappa_{\boldsymbol{S}}^{3}$ | $\kappa_{H}^{3}$ | McKinley |  |
|  | 4 | $e_{\boldsymbol{S}}^{4}$ | Concussion | $e_{\boldsymbol{H}}^{4}$ | Warren |  |  | 4 | $\kappa_{\boldsymbol{S}}^{4}$ | $\kappa_{\boldsymbol{H}}^{4}$ | McKinley |

is confidential w.r.t.

$$
\left.\begin{array}{ll}
\mathcal{C}=\{ & c_{1}=\{\operatorname{SSN}\},
\end{array} \quad c_{3}=\{\text { Name, HurtBy }\}, ~ 子, ~ c_{2}=\{\text { Name }, \text { Illness }\}, \quad c_{4}=\{\text { Illness }, \text { HurtBy }\} \quad\right\}
$$

## A Priori Knowledge under Alternative Fragmentation

Attacker's view on $r$ based on $f_{1}$ :

| $R$ | SSN | Name | Illness | HurtBy | Doctor |
| :---: | :---: | :---: | :--- | :---: | :--- |
|  | $?$ | $?$ | Borderline | $?$ | White |
|  | $?$ | $?$ | Laceration | $?$ | Warren |
|  | $?$ | $?$ | Laceration | $?$ | Warren |
|  | $?$ | $?$ | Concussion | $?$ | Warren |

Suppose attacker knows a priori:

1. $\left(\forall X_{S}\right)\left(\forall X_{N}\right)\left(\forall X_{I}\right)\left(\forall X_{H}\right)\left[R\left(X_{S}, X_{N}, X_{I}, X_{H}\right.\right.$, White $) \Rightarrow\left(X_{I} \equiv\right.$ BLine $\left.)\right]$
2. $\left(\forall X_{S}\right)\left(\forall X_{N}\right)\left(\forall X_{H}\right)\left(\forall X_{D}\right)\left[R\left(X_{S}, X_{N}\right.\right.$, BLine, $\left.\left.X_{H}, X_{D}\right) \Rightarrow\left(X_{N} \equiv X_{H}\right)\right]$

A Priori Knowledge is harmless (though premises satisfied)

1. Association Doctor $\leftrightarrow$ Illness already known from $f_{1}$
2. For neither $X_{N}$ nor $X_{H}$ a constant is known

## About the Creation of Appropriate Fragmentations

As seen in example: Given $\langle R| A_{R}\left|S C_{R}\right\rangle, \mathcal{C}$ and prior Some fragmentations achieve inference-proofness, others do not

Task: Create inference-proof fragmentation for given setting

- Can be modelled as Binary Integer Linear Program
- Optimization Goal: Minimize number of "encrypted attributes"
- Solver outputs feasible solution iff Inference-proof fragmentation exists

## Conclusion and Future Work

## Conclusion and Future Work

What has been achieved?

- Existing approach to confidentiality by fragmentation is
- Modelled logic-orientedly within CIE-framework
- Extended by attacker's a priori knowledge
- Within modelling: Formal proof of inference-proofness
- Algorithm for computing inference-proof fragmentations

What might be done in future?

- Extending feasible a priori knowledge $\rightarrow$ Sufficient \& necessary condition
- Analyzing other approaches to confidentiality by fragmentation

## Thank you for your attention!
